

Agence de Médecine Préventive

www.aamp.org

AMP (Agence de Médecine Préventive) is a non-profit organization created in 1972. Our vocation is to promote preventative medicine by engaging in appropriate actions in Vaccinology and communicable diseases. We also create activities in training program development for the Health Ministries of developing countries. Our activities are made possible by successful public and private partnerships. At AMP, our technical expertise is always evolving to better respond to current needs in capacity building and training program development for developing countries. To respond to the needs and requests of our partners, we have developed specific fields of expertise in applied training and education for the healthcare sector. Our missions are carried out within a context of international cooperation for the promotion and transfer of knowledge and techniques to developing countries.

Today, AMP's technical capacity in training program development allows us to provide consulting in training program development, create tailor-made classroom training and e-Learning programs and communicate widely on technical and scientific themes.

AMP will be present at the 3rd eLearning Africa Conference to share our skills and demonstrate our accomplishments in online and offline multimedia learning products.

AMP will be at stand M18 and present the following products:

- 1) The distance training CD-Rom of our EPIVAC blended learning program for district medical officers in sub-Saharan Africa.
- 2) The learning management system for our IEIAA course (International Course on Epidemiology and Applied Information Technology in Africa).
- 3) Our learning CD-Rom created in response to a request by WHO within the framework of the GAVI Alliance supported Yellow Fever Initiative: i) Investigation of a yellow fever epidemic, ii) Implementation of a yellow fever vaccination campaign, iii) Yellow fever documentary resources library.

The "investigation of a yellow fever epidemic" CD-Rom received special attention. The Organizing Committee has chosen it to be presented in the Demonstration and Best Practice Area. This CD-Rom mixes the entertaining aspects of a video game with active learning processes to provide medical personnel with an immersive training tool for the epidemiological investigation of yellow fever in sub-Saharan Africa.
